

PLAN TO SAVE

While Home and Commercial building energy costs in the North continue to rise, the costs for pellet boilers, stoves and Canadian produced pellets remains stable. Installing a pellet boiler or stove can cut your heating and domestic hot water costs significantly, and there are pellet suppliers and installers in most regions.

By planning ahead, and not waiting until peak seasons to install pellet boilers or stoves, you can get ahead of the game and be ready for when winter hits again.

Start with an energy assessment to find out where you could improve. Then talk to a certified installer in your community about the unit that's right for your needs.
